Q.1 Insertion sort

6, 16, 12, 27, 9, 1, 18, 5, 31

6, 16, 12, 27, 9, 1, 18, 5, 31	$K = 16$
16, 6, 12, 27, 9, 1, 18, 5, 31	$K = 12$
16, 12, 6, 27, 9, 1, 18, 5, 31	$K = 27$
27, 16, 12, 6, 9, 1, 18, 5, 31	$K = 9$
27, 16, 12, 9, 6, 1, 18, 5, 31	$K = 1$
27, 16, 12, 9, 6, 1, 18, 5, 31	$K = 18$
27, 18, 16, 12, 9, 6, 5, 1, 31	$K = 5$
27, 18, 16, 12, 9, 6, 5, 1, 31	$K = 31$
31, 27, 18, 16, 12, 9, 6, 5, 1,	none

Time complexity = $O(n^2)$

for the worst case suppose all unsorted elements, where comparison and swapping increases in each iteration as 1, 2, 3, ..., n so it becomes a series of $\frac{n(n-1)}{2} = O(n^2)$

Loop invariant:

At the start of each loop iteration or for loop, the sub array $A[1 \dots j-1]$ consists of elements originally in $A[1 \dots j-1]$ but in sorted order.

Initialization:

At the start of for loop $j=2$, the array has a first sorted element.

Maintainance:

At the start of each iteration, suppose $j = 4$ the element of the inner loop will shift forward towards ~~more~~ sorted position. Therefore $A[1-3]$ is sorted in this case.

Termination:

At the end of loop we have array $A[1-n]$ that is sorted.

Q.2 Merge sort

~~6, 16, 12, 27, 9, 1, 18, 5, 31~~ $\lceil \frac{9}{2} \rceil = 4$

~~[6, 16, 12, 27]~~

~~[9, 1, 18, 5, 31]~~

~~[6, 16]~~

~~[12, 27]~~

~~[9, 1] [18, 5, 31]~~

~~16 16~~

~~12 27~~

~~9 1 18 5 31~~

~~[16, 16]~~

~~[27, 12]~~

~~[9, 1]~~

~~[31, 18, 5]~~

~~6, 12, 16, 27~~

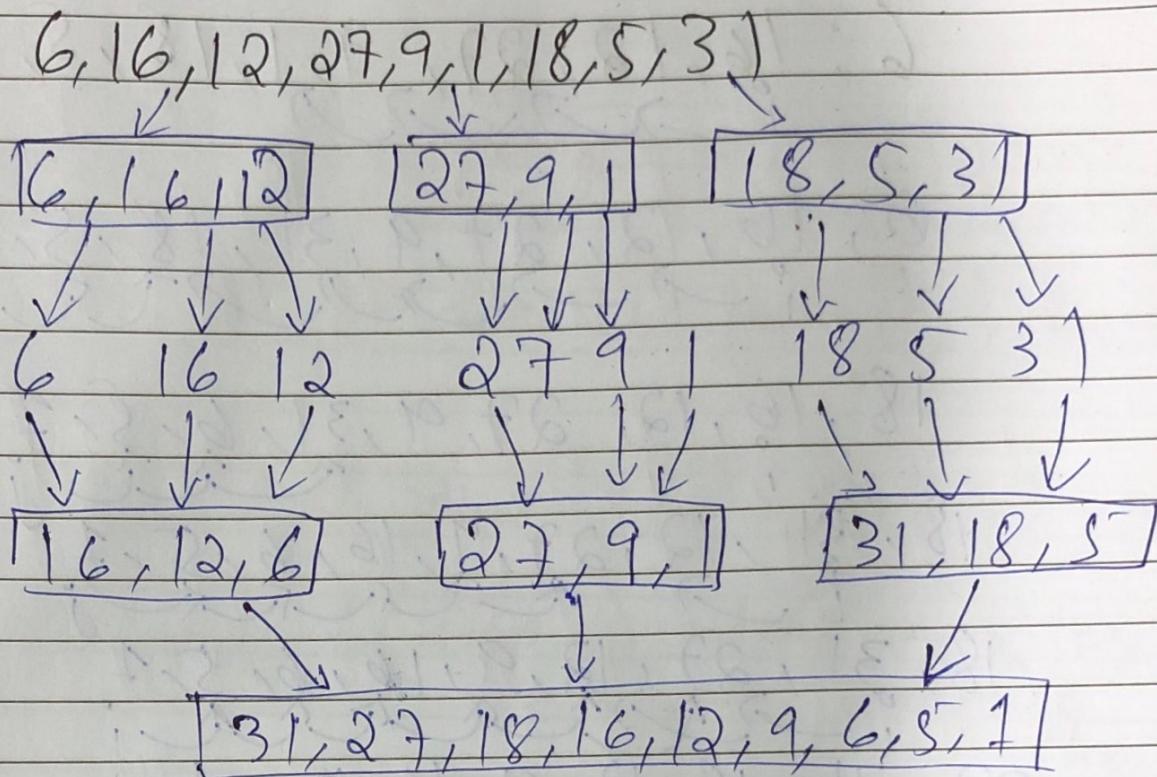

~~[27, 16, 12, 6]~~

~~1, 5, 8, 9, 31~~

~~[31, 10, 9, 5, 1]~~

~~[31, 27, 18, 16, 12, 9, 6, 5, 1]~~

Q. Merge Sort

Time complexity:

$$T(n) = aT(n/b) + f(n)$$

$$a = 3, b = 3 \quad f(n) = O(n)$$

$$T(n) = 3T(n/3) + O(n) \quad \therefore a = b^d$$

$$O(n^{\log_3 3})$$

$$O(n \log n)$$

Q.3 Quick Sort.

- 6, 16, 12, 27, 9, 1, 18, 5, 3, P
 $\downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow$
 $j \rightarrow 6$
- 6, 16, 12, 27, 9, 31, 18, 5, 1, $\rightarrow 6$
 $\downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow$
 j
- 18, 16, 12, 27, 9, 31, 6, 5, 1, $\rightarrow 18$
 $\downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow$
 j
- 18, 31, 12, 27, 9, 16, 6, 5, 1, $\rightarrow 18$
 $\downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow$
 j
- 18, 31, 27, 12, 9, 16, 6, 5, 1, $\rightarrow 18$
 $\downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow$
 j
- 27, 31, 18, 12, 9, 16, 6, 5, 1, $\rightarrow 27$
 $\downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow$
 j
- 31, 27, 18, 12, 9, 16, 6, 5, 1, $\rightarrow 12$
 $\downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow \uparrow \downarrow$
 j
- 31, 27, 18, 16, 12, 9, 6, 5, 1, sorted.

Before first iteration $i = p+1$ and $j = n-1$
 No value lie between P and i .

As $arr[i] \geq P$, increments i and
 $arr[j] \leq P$ decrements j

As j crosses i , swap $arr[i]$ with
 Do At termination, pivot has elements
 greater on one side and lesser on other
 side.

Date:

Q.4 Considering an input array having n number of cards.

They use of divide and conquer strategy by dividing array into n².
Splitting can be done recursively, base case is n=1

A relation such that $T(n) = 2T(n/2) + O(n)$

where $T(n) = O(n \log n)$ using master iterative method.

For linear $O(n)$ case.

We can use Boyer-Moore Algorithm where we can have count and max-index variable.
While travelling array. check if

$\text{Array}[\text{max-index}] == \text{Array}[i]$,
count++

else count--

If count == 0, Max-index = i
count = 1

since linear traversal of array and finding element so

$$= O(1) + O(n) = O(n)$$

Date:

Q.5 In order to minimize the sum, pair up the numbers in a way that largest number would be added to the smallest element of array. Thus we can use Merge sort to sort elements, then selecting an element from odd index ($1, 3, 5, 7, n-1$) and other from even index ($2, 4, 6, 8, \dots, n$) of sorted array.

$$Q.6 n^3 - 2n + 1 = O(n^3)$$

add constants $\Rightarrow 1 + 1 = 2$

$$n^3 - 2n + 1 \leq c(n^3)$$

$c = 2$

$$n^3 - 2n + 1 \leq 2n^3$$

When $n_0 = 1 \Rightarrow 0 \leq 2$, Hence $n_0 = 1$

$$5n^2 \log n + 2n^2 = O(n^2 \log n)$$

$$5n^2 \log n + 2n^2 \leq c(n^2 \log n) \quad c = 5+2 = 7$$

$$5n^2 \log n + 2n^2 \leq 7n^2 \log n$$

When $n_0 = 2$ we have

$$28 \leq 28 \text{ so } \underline{n_0 = 2}$$

Q.7

Mathematical way of representing time complexity is Asymptotic notation, also refers to study of function f as n reaches infinity

Big O (upper bound) | Big Ω (lower bound)

$$f(n) = O(g(n)) \quad | \quad f(n) = \Omega(g(n))$$

$$f(n) \leq c(g(n)) \quad | \quad f(n) \geq c(g(n)).$$

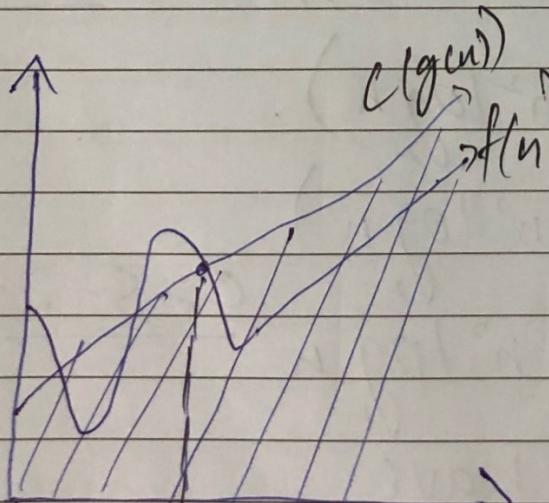

if $O \leq f(n) \leq c(g(n))$ iff

where $n \geq n_0$

$$O \leq c(g(n)) \leq f(n)$$

we say $f(n)$ is big-O of $g(n)$, we say $f(n)$ is Omega of $g(n)$

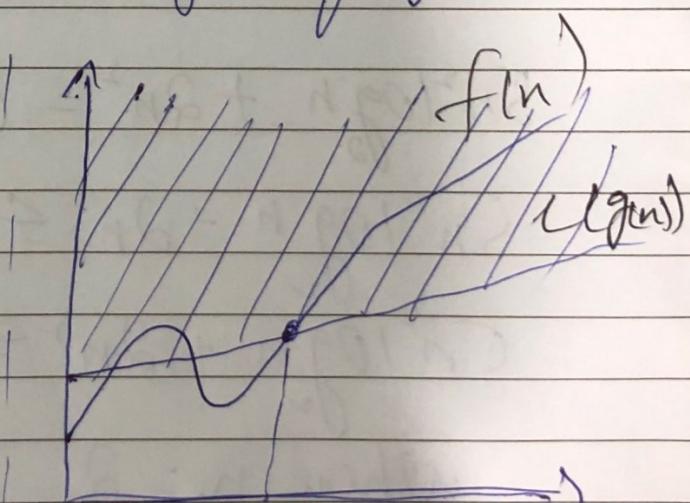

where $n_0 \geq n_0$

$$f(n) = O(g(n))$$

$$\text{ex } n^2 + n = O(n^3)$$

$$c=1 \text{ at } n \geq 2$$

$$f(n) = \Omega(g(n))$$

$$\text{ex } n^3 + 4n^2 = \Omega(n^3)$$

$$c=1 \text{ at } n \geq 1 \quad \text{ALBA}$$

Big- Θ (tight bound)

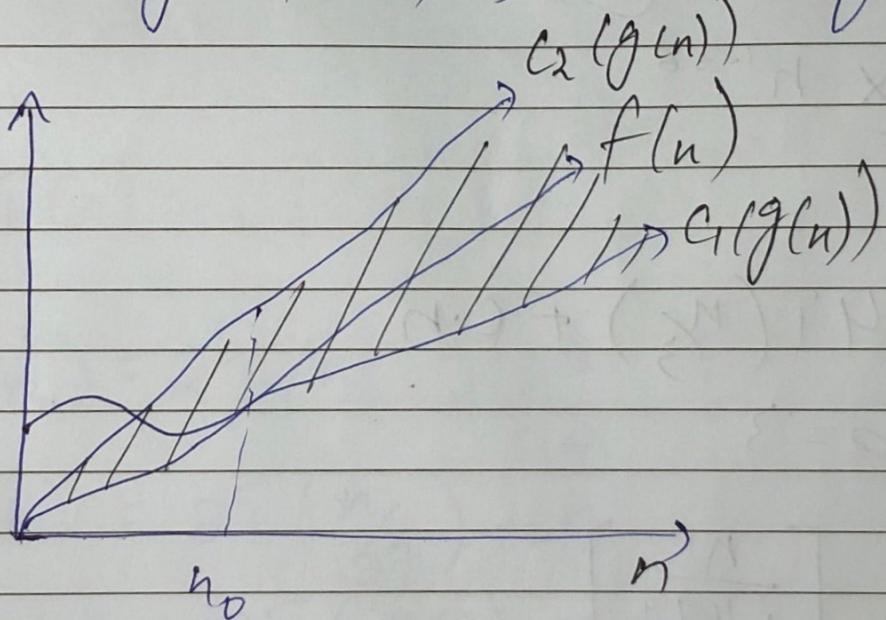

$$f(n) = \Theta(g(n))$$

$$f(n) = c_1 g(n)$$

$$\text{if } 0 \leq c_1 g(n) \leq f(n) \leq c_2 g(n)$$

where $n \geq n_0$

we say $f(n)$ is theta of $g(n)$.

$$f(n) = \Theta(g(n))$$

$$\text{ex } n^2 + 5n \in \Theta(n^2)$$

$$n^2 + 5n \in \Theta(n^2)$$

$$c_1 = 1$$

$$c_2 = 6$$

at $n \geq 1$

Q.8 Solve using Master Theorem.

$$T(n) = 2T\left(\frac{n}{3}\right) + c \cdot n^2, f(n)$$

$$a=2 \quad b=3$$

$$n^{\log_3 2} \times \left[\frac{n^2}{n^{\log_3 2}} \right]$$

$$n^{0.63} \times [n^{1.36}] \rightarrow n^r : r > 0 \Rightarrow O(n)^r$$

$$\begin{aligned} n^{0.63} \times n^{1.36} \\ \Rightarrow n^2 \end{aligned}$$

$$T(n) = 4T\left(\frac{n}{3}\right) + c \cdot n$$

$$a=4 \quad b=3$$

$$n^{\log_3 4} \times \left[\frac{n^1}{n^{\log_3 4}} \right]$$

$$n^{1.26} \times \left[\frac{n^1}{n^{1.26}} \right] \rightarrow n^0 \text{ so } O(1)$$

$$n^{1.26}$$

$$T(n) = 8T\left(\frac{n}{2}\right) + C \cdot n^3$$

$$a = 8 \quad b = 2$$

$$n \log_2 8 \times \left[\frac{n^3}{n \log_2 8} \right]$$

$$n^3 \times \left[\frac{n^3}{n^3} \right] \rightarrow n^0$$

$$n^3 \times \log n$$

Q.9 $T(n) = 2T\left(\frac{n}{3}\right) + n^2$, $T(1) = 1$

$$T\left(\frac{n}{3}\right) = 2T\left(\frac{n}{9}\right) + \frac{n^2}{27} \quad \rightarrow ①$$

$$T\left(\frac{n}{9}\right) = 2T\left(\frac{n}{81}\right) + \frac{n^2}{81}$$

$$T\left(\frac{n}{81}\right) = 2T\left(\frac{n}{243}\right) + \frac{n^2}{729}$$

$$\rightarrow 2\left(2T\left(\frac{n}{9}\right) + \frac{n^2}{27}\right) + n^2$$

$$\rightarrow 4T\left(\frac{n}{9}\right) + \frac{2n^2}{27} + n^2 \quad \rightarrow ②$$

$$\rightarrow 4\left(2T\left(\frac{n}{81}\right) + \frac{n^2}{81}\right) + \frac{2n^2}{27} + n^2$$

$$= 8T\left(\frac{n}{81}\right) + n^2 + \frac{2n^2}{27} + \frac{4n^2}{81} \quad \rightarrow ③$$

$$= 2T\left(\frac{n}{27}\right) + n^2 \quad \rightarrow \begin{matrix} n^2 \\ (g.p) \end{matrix}$$

Date:

$$2^k T\left(\frac{n}{2^k}\right) + n^2$$

$$3^k = n$$

$$2^k (1) + n^2$$

$$\log_3 3^k = \log_3 n$$

$$2^{\log_3 n} + n^2$$

$$k = \log_3 n$$

$$= O(n^2)$$

$$T(n) = 4T\left(\frac{n}{3}\right) + n \quad (T(1) = 1)$$

$$T\left(\frac{n}{3}\right) = 4T\left(\frac{n}{9}\right) + \frac{n}{3}$$

$$T\left(\frac{n}{9}\right) = 4T\left(\frac{n}{27}\right) + \frac{n}{9}$$

$$T\left(\frac{n}{27}\right) = 4T\left(\frac{n}{81}\right) + \frac{n}{27}$$

$$3^k = n$$

$$= 4(4T\left(\frac{n}{9}\right) + \frac{n}{3})$$

$$k = \log_3 n$$

$$= 16T\left(\frac{n}{9}\right) + 4\frac{n}{3} \Rightarrow ②$$

$$= 16(4T\left(\frac{n}{27}\right) + \frac{n}{9}) + 4\frac{n}{3}$$

$$= 64T\left(\frac{n}{27}\right) + 4\frac{n}{3} + \frac{16n}{9} \Rightarrow ③$$

$$= 2^{k+1}T\left(\frac{n}{3^k}\right) + n\left(\frac{4}{3} + \frac{16}{27} + \frac{64}{81}\right)$$

$$= 2^{k+1}T\left(\frac{n}{n}\right) + O(n) \times \text{constant}$$

$$= 2^{\log_3 n + 1} + O(1)$$

$$= n \log_3 4 + O(n) \Rightarrow n^{1.26}$$

$$\begin{cases} 4^{\log_3 n} \\ n \log_3 4 \end{cases}$$

Date:

Q. 10 If $f(n) = n$, $O(g(n))$ will be

$$f(n) \neq \leq c \cdot g(n)$$

$$\Omega(n(n)) \Rightarrow \log n$$

$$g(n) + h(n) \neq f(n)$$

$$n + \log n \neq n \quad \text{so false}$$

2 - suppose $f(n) = n$ $g(n) = 2n$.

$$f(n) = O(g(n))$$

$$f(n) = \Omega(g(n))$$

$$f(n) \leq c \cdot n$$

$$f(n) \geq c \cdot n$$

$$n \leq c \cdot n$$

$$2n \geq n$$

so true for $(f(n))^3 = \Theta((g(n))^3)$

3 - $f(n) = n$ $O(g(n)) = \Omega(\log n)$.

$$(f(n))^2 = (g(n))^2$$

$$(n^2) \neq (\log n)^2 \quad \text{false.}$$
