Class activity (Monday 27 sep)
Date:

Assuming that a calender has already been integrated with electronic diary, user can schedule the meetings with respect to date and time. The venue can also be chosen. A notification can be setup for alerting about upcoming meetings with an auto-generated email.

Usuability specification:
- The date can be input using a dialog box or by just entering it so that the concept of substitutivity can be applied.
- There should be constant interface like if the user open any month for scheduling a meeting, consistency to be applied.
- To make the system familiar with the user, a main calender icon can be used as a part of metaphor.
- Multithreading can also be applied in a way if user can schedule a meeting while attending the other meeting.
- If user is scheduling a new meeting on the same date and time, a pop-up message could show up as a part of task migratability.
- Task adequacy would allow user to select any possible date and time for a meeting and task conformance would confirm that a particular date and time has been selected.
